Art Unit: 1762

1. The amendment filed 7/12/04 has been considered and entered. Claims 5 and 31 have

Page 2

been canceled. Claims 1-4,6,7,27-30,32 and 33 remain in the application.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found

in a prior Office action.

3. in light of the amendment filed 7/12/04, the 35 USC 112 second paragraph rejection has

been necessitated.

Claim Rejections - 35 USC § 112

4. Claims 1 and 27 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The claim recites Markush language that recites a group of "conductive polymers", however, the term "graphite" is not a conductive polymer. Correction is required.

Application/Control Novel

Art Unit: 1762

Claim Rejections - 35 USC § 103

5. Claims 1-4,6,7,27-30,32 and 33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chen (6,277,263) in combination with Rapoport et al. (5,298,687) further in combination with Applicant's admitted state of the art (specification, pg. 2).

Chen (6,277,263) teaches method for electrolytically depositing copper on a semiconductor. A copper bath is utilized to electroplate copper onto a seed layer or to enhance an ultra-thin copper seed layer, which has been deposited on a barrier layer by PVD. When used for seed layer enhancement, the resulting copper seed layer provides an excellent conformal copper coating that allows the microstructures to be filled with copper layer having good uniformity (see abstract). The substrate can have vias or trenches lined with a barrier layer.

Chen (6,277,263) fail to teach the use of a conductive polymer for the seed layer.

Rapoport et al. (5,298,687) teaches a multilayer interconnect system and method of manufacturing. Looking at figs. 1-2, a first metal seed layer (2) is applied to a substrate (1). Next a second seed layer (4) is applied to create a continuous seed layer prior to subsequent depositing. The seed layer is a conductive polymer (col. 3, lines 40-62).

Therefore, it would have been obvious for one skilled in the art at the time the invention was made to have modified Chen (6,277,263) seed layer with the conductive polymer as evidenced by Rapoport et al. (5,298,687) with the expectation of achieving similar results, i.e. a conformal, continuous conductive coating.

Chen (6,277,263) in combination with Rapoport et al. (5,298,687) fail to teach the thickness of the conductive polymer seed layer being from 50-1500 angstroms

Art Unit: 1762

Applicant's admitted state of the art (specification, pg. 2), under the heading, background of the invention, details that it is known in the art to form seed layers with thicknesses from 50-1500 angstroms.

Therefore, it would have been obvious for one skilled in the art at the time the invention was made to have applied the seed layer with a thickness in the claimed range as evidenced by Applicant's admitted state of the art (specification, pg. 2) with the expectation of achieving similar success. Furthermore, it is the Examiner's position that the thickness of a coating layer, in this case the seed layer, is a "result effective" variable which can be optimized by one skilled in the art depending upon the desired final product produced.

Chen (6,277,263) in combination with Rapoport et al. (5,298,687) further in view of Applicant's admitted state of the art (specification, pg. 2) fails to teach the conductive polymer being an acetylene, aniline, pyrrole or thiopene.

Features described above are incorporated here.

Jonas et al. (6,358,437 B1) and Cloots et al (6,340,496 B1) both teach utilizing substituted conductive polythiophenes and polypyrroles for forming conductive coatings (abstract).

Therefore, it would have been obvious for one skilled in the art at the time the invention was made to have modified Chen (6,277,263) in combination with Rapoport et al. (5,298,687) further in view of Applicant's admitted state of the art (specification, pg. 2) conductive polymer seed layer with Jonas et al. (6,358,437 B1) and Cloots et al (6,340,496 B1) conductive polymers of polythiophenes and polypyrroles with the expectation of achieving similar success.

Art Unit: 1762

Response to Amendment

6. Applicant's arguments filed 7/12/04 have been fully considered but they are not persuasive.

Applicant argued that Chen (6,277,263) teaches electroplating to "repair" the "seed layer" as opposed to using a conductive polymer as well as the conductive polymer of Rapoport et al. (5,298,687) being a "metal filled" polymer.

While the Examiner acknowledges the fact that Rapoport et al. (5,298,687) conductive polymers are "metal filed" and Jonas et al. (6,358,437 B1) and Cloots et al (6,340,496 B1) conductive polymers are not "metal filled", it is the Examiner's position that one skilled in the art at the time the invention was made would have had a reasonable expectation of achieving similar success regardless of which "type of conductive polymer" is utilized. Both types of conductive polymers are known and taught to be effective and conductive materials.

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37

Art Unit: 1762

Page 6

however, will the statutory period for reply expire later than SIX MONTHS from the mailing

CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

date of this final action.

8. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Brian K Talbot whose telephone number is (571) 272-1428. The

examiner can normally be reached on Monday-Friday 6AM-3PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Shrive P Beck can be reached on (571) 272-1415. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
